add_to_wishlist : (wishlist : FavoriteList) remove_from_wishlist : (wishlist : FavoriteList) purchase():WaitingOrders

.1

1. **add_to_wishlist** method gets **Wishlist** argument and add it to **FavoriteList** property if its not existed. If the product object is already added to **FavoriteList** property, prints “the product already existed”.

2. **remove_from_wishlist** method gets **Wishlist** argument and checks if product object already existed inside the **FavoriteList** property, remove it. If product object is not inside the Wishlist class, prints “the product doesn’t existed”.

Item
price : int amount : int product : Product

Wallet
wallet_id : int transactions : array(Transaction)
deposit(amount:int) withdraw(amount: int)

1. **deposit** method gets **amount** argument and charges the account. And makes an object from **Transaction** class and gives **date** and **transaction_type** as deposit type and keeps money in **transactions** property.

ShoppingCart
cart_items : array (CartItem) broken_products:array(CartItem)
+add_item(cart_items:CartItem):void +remove_item(cart_items:CartItem):void +increase_item(cart_items:CartItem):void +decrease_item(cart_items:CartItem):void

1. **add_item** method gets **cart_items** argument and checks if the product object already existed in **cart_items** or not. If the product object doesn't existed add it to **cart_items** . if the product object existed, and repeating this method repeatedly, the amount of the product object gets higher and keep it in **cart_items**.

2. **remove_item** method gets **cart_items** argument and checks if the product object already existed in **cart_items** or not. if the product object already existed in **cart_items**, removes it from **cart_items** . if the product object doesn't existed, prints error message "product doesn't existed in cart".
